# Introduction

- ▶ **Active Authentication:**
  - ▶ The process of continuously verifying a user based on his/her ongoing interaction with the computer
- ▶ **Stylometry:**
  - ▶ The study of linguistic style applied to user identification
- ▶ **This work:** Evaluating stylometric sensors for active authentication
  - ▶ Realtime-like multi-user environment
  - ▶ Time-based overlapping sliding windows  $\Rightarrow$
  - ▶ High-paced authentication decision making

# Motivation

- ▶ Increasing interest in **behavioral biometrics** [AT07]
  - ▶ Use common hardware to authenticate (mouse, keyboard)
- ▶ Yet achieved performance is mixed  $\Rightarrow$  better solutions required
- ▶ Most work uses static data
  - ▶ **Active Linguistic Authentication Dataset** [JNS<sup>+</sup>13]: typical HCI
- ▶ Stylometry: effective identifier
  - ▶ High-level behavioral biometric for authentication systems
- ▶ **Primary goal**: use stylometric sensors in multi-modal systems  
[ keyboard | mouse | web-browsing | **stylometry** ]

# Motivation – Contd.

- ▶ Implications on forensic: post-mortem stylometric analysis
  - ▶ Effective features in “noisy” environment?
  - ▶ Sliding window size, overlap?
  - ▶ Idle periods (no input)?

- 3 Dataset
- 4 Methodology
- 5 Evaluation
- 6 Conclusion

# Active Authentication

- ▶ **Active** authentication  $\Rightarrow$  sensor data varies with time
  - ▶ Verification must be on *recent* data only
- ▶ Different biometrics for different user activities
  - ▶ Web browsing  $\Rightarrow$  mouse + web activity
  - ▶ Document editing  $\Rightarrow$  keystrokes + stylometry
- ▶  $\Rightarrow$  Multi-modal authentication [SZJK07]
  - ▶ Robust to dynamic real-time HCI
  - ▶ Sensor fusion  $\Rightarrow$  greater error reduction [AP95]

# Active Authentication

# Stylometry

- ▶ **Stylometry**: authorship attribution based on linguistic style
  - ▶ Features: function words, grammar,  $n$ -gram frequencies...
  - ▶ Used also for **profiling**: gender, age, native language
- ▶ In active authentication context: **verification**
  - ▶ Unary author-specific classifiers to determine `user/attacker`
- ▶ Challenges:
  - ▶ Open-world settings: much harder than “standard” stylometry
  - ▶ Inconsistent input frequency  $\Leftrightarrow$  stylometry data requirements
- ▶ But:
  - ▶ Unique idiosyncrasies like misspellings / keystroke patterns

# Stylometry

# Dataset Collection

- ▶ Used the full **Active Linguistic Authentication Dataset** [JNS<sup>+</sup>13]
- ▶ Computer input collected in a simulated work environment
  - ▶ One 40-hour week data collected from 80 temps
  - ▶ Research and writings tasks
  - ▶ Tracked keyboard, mouse and web browsing behavior
  - ▶ **Uniformity**: same hardware for all workers

# Dataset Preprocessing

- ▶ Used 67 of the 80 users w/ minimum 16.67 hours of activity

Min. chars/user	17,027
Max chars/user	263,165
AVg.	84,206
Total	5,641,788

- ▶ All 5-day **keyboard** and mouse events gathered in one file/user
  - ▶ Divided into 5 equal-size folds
  - ▶ Reduced all > 2 min idle periods to *exactly* 2 min
  - ▶ Collected *all* keystrokes: alphanumeric & special keys (shift, ctrl, backspace...)
  - ▶ Special chars converted to 1-char placeholders (e.g. backspace  $\Rightarrow \beta$ )

# Previous Evaluation

- ▶ Initial data-based windows analysis on 14 users [JNS<sup>+</sup>13]:
  - ▶ **Day windows**: 88% accuracy  
*k*-NN classifier + Manhattan distance + char *n*-grams
  - ▶ **100-1000-word windows**: 93% accuracy  
No overlap, SVM classifier + extensive feature set
- ▶ Proof of concept, but:
  - ▶ Only 14 users
  - ▶ Data-wise windows (whole day, *X* words) – not useful for AA systems
    - ▶ Fast decision making is required
    - ▶ Miss attacks (“bad” windows w/ “good” data)

# Previous Evaluation

# Real-Time Approach

- ▶ Closed-world classifier: one SVM trained on all 67 users
- ▶ Time-wise overlapping windows:
  - ▶ Size ( $\geq$ ): 10, 30, 60, 300, 600 & 1200 secs
  - ▶ Overlap ( $\leq$ ): 10 / 60 secs
- ▶ Overlap: allow sufficient data + frequent decisions
- ▶ Elimination of idle periods allows maximum #windows evaluation

## 30-second windows, 10-seconds overlap:

# Real-Time Approach

- ▶ Closed-world classifier: one SVM trained on all 67 users
- ▶ **Time-wise overlapping windows:**
  - ▶ Size ( $\geq$ ): 10, 30, 60, 300, 600 & 1200 secs
  - ▶ Overlap ( $\leq$ ): 10 / 60 secs
- ▶ Overlap: allow sufficient data + frequent decisions
- ▶ Elimination of idle periods allows maximum #windows evaluation

  - ▶ Variation of the Writeprints feature-set [AC08]
  - ▶ Vast range of linguistic features
    - char/word/POS  $n$ -grams, function words, word lengths, digits
  - ▶ “Applies” special chars: `chββCchββhicago`  $\Rightarrow$  Chicago
  - ▶ Frequency-based features normalization
  - ▶ Extracted using the JStylo authorship attribution framework [MAC<sup>+</sup>12]

# Real-Time Approach – Contd.

- ▶ The **AA feature-set**:
  - ▶ Variation of the Writeprints feature-set [AC08]
  - ▶ Vast range of linguistic features
    - char/word/POS  $n$ -grams, function words, word lengths, digits
  - ▶ “Applies” special chars:  $ch\beta\beta Cch\beta\beta hicago \Rightarrow Chicago$
  - ▶ Frequency-based features normalization
  - ▶ Extracted using the JStylo authorship attribution framework [MAC<sup>+</sup>12]

## Real-Time Approach – Contd.

- ▶ Applied minimum chars/window thresholds
  - ▶ Discarded too small windows (below threshold):  
“not enough data to decide”
  - ▶ Thresholds: 100–1000 characters (steps of 100)
  - ▶ Availability  $\Leftrightarrow$  potential accuracy
- ▶ Only sensors w/ train data for *all* users after filtering are kept
  - ▶ 37 of the 60 sensor configurations are kept

## Real-Time Approach – Contd.

# Outline

- 1 Motivation
- 2 Background
- 3 Dataset
- 4 Methodology
- 5 Evaluation**
- 6 Conclusion

# Evaluation

- ▶ Measure averaged FAR & FRR on 5-fold cyclic cross-validation
- ▶ Stylometry sensors intended for a multimodal system
  - ▶ Requires knowledge of expected FAR/FRR
- ▶  $\Rightarrow$  analysis technique:

# Evaluation

- ▶ Measure averaged FAR & FRR on 5-fold cyclic cross-validation
- ▶ Stylometry sensors intended for a multimodal system
  - ▶ Requires knowledge of expected FAR/FRR
- ▶ ⇒ analysis technique:

# Evaluation

- ▶ Stylometry sensors intended for a multimodal system
  - ▶ Requires knowledge of expected FAR/FRR
- ▶  $\Rightarrow$  analysis technique:

# Evaluation – Contd.

## Availability by minimum char thresholds:

- ▶ The larger the window  $\Rightarrow$  the higher its availability
- ▶ Windows < 300 secs – not very useful

# Evaluation – Contd.

## Average FAR/FRR:

- ▶ Strict sensors
- ▶ The larger the window  $\Rightarrow$  the less affected by min char thresholds

# Outline

- 1 Motivation
- 2 Background
- 3 Dataset
- 4 Methodology
- 5 Evaluation
- 6 Conclusion

# Conclusion

- ▶ Proof of concept in [JNS<sup>+</sup>13] – insufficient for real-world settings
  - ▶ With small time-wise windows: performance deteriorates drastically
- ▶ Still, can be used in a mixture-of-experts approach – multi-modal systems
- ▶ Classification approach still limited
  - ▶ Should attempt open-world classifiers
  - ▶ Should attempt low-level linguistic features, typing patterns
- ▶ Immediate next step: fusion
  - ▶ Initial closed-world eval on 19 users: < 1% FAR/FRR! [FSA<sup>+</sup>13]
  - ▶ To be continued...
