

1. Let  $f, g : \mathbb{N} \rightarrow \mathbb{N}$  be two functions. Recall that  $f = O(g)$  if there exists a  $c > 0$  such that  $f(n) \leq c \cdot g(n)$  for every sufficiently large  $n$ . We say that  $f = \Omega(g)$  if  $g = O(f)$  and that  $f = \Theta(g)$  if  $f = O(g)$  and  $g = O(f)$ . Also, we say that  $f = o(g)$  if for any  $\varepsilon > 0$ ,  $f(n) \leq \varepsilon \cdot g(n)$  for every sufficiently large  $n$ . Finally, we say that  $f = \omega(g)$  if  $g = o(f)$ .

Prove or disprove:

- (a)  $(5n)! = O(n!^5)$ .
  - (b) If  $f(n) = O(n)$  then  $10^{f(n)} = O(2^n)$ .
  - (c)  $\log(n!) = \Theta(n \log n)$ .
  - (d) Every two functions  $f, g$  satisfy  $f = O(g)$  or  $g = O(f)$ .
  - (e) There exists a function  $f$  such that  $f(n) = O(n^{1+\varepsilon})$  for any  $\varepsilon > 0$  but  $f(n) = \omega(n)$ .
2. For two languages  $L_1, L_2$  define  $L_1 \Delta L_2 = (L_1 \setminus L_2) \cup (L_2 \setminus L_1)$ . We say that a class  $C$  is closed under  $\Delta$  if  $L_1, L_2 \in C$  implies  $L_1 \Delta L_2 \in C$ . For each class decide if it is closed under  $\Delta$  (or show that it is equivalent to an open question): P, NP,  $\text{NP} \cap \text{coNP}$ .
3. Prove that each of the following problems can be solved by a polynomial time algorithm:
- (a) Input: A graph  $G$  and a positive integer  $k$ .  
Question: Does  $G$  contain a vertex of degree at least  $\log_2 |V(G)|$  or a clique of size  $k$ ?  
( $V(G)$  denotes the vertex set of  $G$ ).
  - (b) Input: A list of  $n$  positive integer numbers  $A_1, \dots, A_n$  and a number  $T$ . All the numbers are given in unary representation (i.e., a number  $k$  is represented as  $1^k$ ).  
Question: Does exist a subset  $S \subseteq \{1, 2, \dots, n\}$  such that  $\sum_{i \in S} A_i = T$ ?
  - (c) Input: A 3CNF formula  $\phi$  in which each clause contains exactly 3 distinct literals and each variable occurs exactly 3 times.  
Question: Is  $\phi$  satisfiable?  
Hint: Use the fact that any regular bipartite graph has a perfect matching.<sup>1</sup>
4. Let  $A \subseteq \{0, 1\}^*$  be a language which satisfies  $|A \cap \{0, 1\}^n| = n^3$  for all  $n \geq 10$ . Prove that  $A \in \text{NP}$  implies  $A \in \text{coNP}$ .

---

<sup>1</sup>A regular graph is a graph where each vertex has the same number of neighbors. A matching in a graph is a set of edges without common vertices. A perfect matching is a matching which matches all vertices of the graph.
